     [57,8]
        I9,10]
       E11,12]]]
  # np5 = np4. reshope (-1) -> (2,3,2) lik np4 0 (12,) lik
                                                                  tek boyutu hole caring
  6) Iterating Through Numpy Arrays
# API = AP. array ([ 1.2,3,4,5,6,7,8,9,10])
  for x in npl:
     Print (x)
  >>> teker terer elemonlar yazar, alt alto docok sekille.
# np2 = np. orroy ([[1123,4,5], [6,3,8,9,10]])
   for x in np2:
    #print (x) 1,2,3,4,5, ve .6,7,8,9,10 v yozer alt alta.
     for y in x:
        Print (y) - 1,2,3, 4,5,6,7,8,9, 10 sopriorni alt alto yozar.
```

```
# ne3 = ne. or ay ([EE1.2,3], E45.4]], EE 7.8.9], E10.11,12]])
       for 2 10 x:
                              -) all allo 1'den 12'ye
# np. nd:ter()
 for x in np. nditer (np3):
    print(x)
 >>> alt alto 1'den 12'ye boder yotor.
 7) Socting Numby Arrays The Right Way
 np1 = np. acray ( = 6,7,9,0,2,1])
# np sort()
 print (np. sort (np1))
                         > nel arroxini numeria darak
                                                         SITOlor.
 np2 = np. array (["John","Tino", "Aaron", "zed"])
 print (np. sort (np2)) > Alphobetic olorox sirolor.
 np3 = np. array ([ True, Folse, Folse, True])
 print (np. sort (np3)) Z Booleon clarate sirolar. Once felselar
# Return a copy not change the original
Print (np1)
 print (np. sort (np1))
  print (np1)
>>> [6, 7,9,0,2,1]
[0,1, 2,6,7,9]
    I 6,7, 9, 0,2, 13
                                   > npl in ropes depismed aunki 2 printe
                                    Sort roportes copy edip posterdi. Bu yerden
                                    orijinolde depisim
                                                       olmodi
# 2-2
          sorting
 np4 = np. array ([[,7,1,9], [8,3,5,0]])
                         Sucoloma ogeler arosindo breysel olome yopilir.
>>> [[18,7,9], [0,3,58]]
```

```
8) Searching Numpy Arrays The Easy Way
# Search
np1 = np.orroy ([ 1,2,3,4,5,6,7,8,9,10])
x = np. where (np1 = = 3)
                             ninteger bu six
print (x)
>>> (array([2], dtype = int bu),) -/this is a tuple
         index of '3"
                          dota type of "3"
(LOJX) toing
>>> 2
                                     nthere one two "3"
np1 = np. array ([11,3,4,5,6,7,8,9,10,3])
x = np. where (np1 = = 3)
Print (x [0])
 >>> [2,10] > you "3" on bulund-ju indexler vern. x50] dedit conte
                                                      typlexin O. indexinde
                                                      soll yerler.
([[col x ] 19n ) tring
>>> [3,3]
# Return even items
  y = np. where (npl %2 ==0)
  print (y) -> tel sogilori
   print (y [0]) - Tex sopriorin indexient yozar.
# Return odd items
 2= np. where (np1 %2 == 1)
```
